Introduction

- Blood is essential for saving lives during medical emergencies, accidents and surgeries.
- Finding suitable blood donors at the right time can be challenging.
- Traditional donor searching methods may cause delays.

The solution

The Blood Donor System Portal provides a centralized platform to connect blood donors with people in need.

It helps manage donor details, blood requests and donor matching.

Problem Statement & Existing System

Problems faced

- Difficulty in finding blood donors during emergencies.
- Donor information is scattered across different sources.
- Manual communication delays the donation process.
- Hard to identify donors by blood group and location.
- No centralized system for requests and donation records.

Existing system

Donor details are kept manually or in separate records, with communication by phone and messages.

Limitations

- Time-consuming process.
- Lack of centralized information.
- Possibility of outdated records.
- Delays in emergency situations.

Objectives

1. Develop a centralized blood donor management portal.
2. Maintain donor information systematically.
3. Allow users to submit blood requests.
4. Identify potential donors by blood group and location.
5. Maintain blood donation history.
6. Reduce the time required to find potential donors.

Proposed System

A centralized portal developed using Zoho Creator.

- Donors can register and provide their details.
- Users can submit blood requests.
- Potential donors are identified by blood group and location.
- Donation details and request status are maintained.
- Administrators manage donor and request information.

Who uses it

- Donors
- Blood requesters
- Administrator

Technologies Used

1

Zoho Creator

Low-code platform used to develop the application.

2

Deluge

Scripting language used for workflow automation.

3

Creator Forms

Used to collect and store information.

4

Creator Reports

Used to view and manage records.

5

Creator Workflows

Used to automate application processes.

System Architecture

1. User Layer

- Donors
- Blood requesters
- Administrator

2. Application Layer

- Zoho Creator forms
- Workflows
- Deluge scripts

3. Data Layer

- Donor records
- Blood requests
- Matching records
- Donation history

Main Modules

Five modules, each organizing one part of the blood donation process.

1	**Donor Registration**	Collects donor details, blood group, location and availability.
2	**Blood Request Management**	Submits and tracks blood requests with blood group, units and hospital details.
3	**Hospital Registration**	Captures hospital details used in blood requests.
4	**Donor Matching**	Identifies potential donors by requested blood group and location.
5	**Donation History**	Maintains records of donations and request status.

Key Modules: Donors & Requests

Donor Registration

- Collects donor personal information.
- Stores donor name and contact details.
- Records blood group and location.
- Maintains donor availability information.
- Helps identify potential donors when a request arrives.

Blood Request Management

- Allows users to submit blood requests.
- Collects patient and requester details.
- Records required blood group and units.
- Stores hospital and location details.
- Tracks status: Pending, Matched or Completed.

Donor Matching Module

- Identifies potential donors based on the requested blood group.
- Uses location information to narrow down donor results.
- Considers donor availability information.
- Stores matching details for further coordination.
- Helps administrators connect requesters with potential donors.

Important note

Matching in this project is for identifying potential donors. Actual blood compatibility and donor eligibility must be confirmed by qualified medical professionals.

Workflow and Process

1

Donor registers in the portal.

2

User submits a blood request.

3

System records the request.

4

Potential donors identified by blood group and location.

5

Requester or admin coordinates with the donor.

6

Donation details and request status updated.

Each request moves from registration to matching to completion, with status updated at every step.

Advantages & Future Enhancements

Advantages

- Centralized donor information.
- Easier donor searching.
- Organized blood request management.
- Better record maintenance.
- Reduced manual effort.

Future enhancements

- SMS and email notifications.
- GPS-based donor search.
- Mobile application.
- Real-time donor availability updates.
- Hospital and blood bank integration.

Conclusion

- The portal provides a centralized approach to blood donor coordination.
- It organizes donor registration, blood requests, donor matching and donation history.
- It simplifies the process of finding potential donors.
- It can be enhanced with real-time notifications and location-based services.

THANK YOU
